Feature Breakdown by Sprint

#1 - Planning + Tech Stack + Initialization

- Initialized the React app and built base layout
- Created project structure, basic auth components
- Worked on schema diagrams and defined entities

#2 - Built search API, input validation

- Developed search API with validations
- Connected backend to form logic
- Implemented role-based access control

#3 - Completed booking API, added confirmation mail logic

- Completed booking API functionality
- Added email confirmation logic
- Built booking confirmation UI

#4 - Created restaurant listing frontend, added filters by category

- Designed restaurant listing pages
- Added filtering by category
- Linked backend data to listing view

#5 - Hooked up login/register pages to backend API and implemented session persistence with cookies/localStorage

- Integrated login and registration pages with backend
- Implemented session persistence

- Validated frontend error messages and success states

#6 - Added alerts for login/logout/booking success/failure

- Added success/failure alerts throughout UI
- Enhanced login/logout user feedback
- Ensured consistent UX with notifications

#7 - Configured deployment with AWS + tested endpoint links

- Set up AWS deployment environment
- Deployed backend services
- Tested all endpoints and routes

#8 - Final bug fixes, feature toggles and deployed backend in EC2

- Applied final bug fixes and performance tweaks
- Integrated feature toggles
- Deployed backend in EC2 and finalized project
